

Appl. No.

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (original) Apparatus (1) for securing inhalation of substantially smokeless air from a smoky room, which apparatus comprises a protection (2) that is arranged over at least nose and mouth at face (4) of a user, to which protection a tightly arranged tubular body (6, 6') is connected, a nozzle is arranged at the end (8) of the tubular body at the inside of the protection adapted to be placed against the mouth of the user, which communicates with an air inlet opening (10) in the other end of the tubular body and the tubular body forms a length (L) in elongated condition that at least extends to adjacent ground level, characterised in that the tubular body (6, 6'), that is formed of flexible material, is compactable and/or expandable and together with the protection (2) in a folded condition forms a package that has its substantial propagation in one plane (P) and requires little space.

2. (original) Apparatus according to claim 1, characterised in further that the tubular body (6, 6') at an

Appl. No.

outer portion in connection to the air inlet opening (10) is provided with a weight (15).

3. (currently amended) Apparatus according to claim 1 [[or 2]], characterised in that the tubular body (6) further comprise a fastening apparatus (14, 14'), suitably adjacent of the air inlet opening (10) in an outer portion of the tubular body, whereby the air inlet opening of the tubular body may be arranged in connection to the lower leg or foot of the user.

4. (currently amended) Apparatus according to ~~any of the preceding claims~~ claim 1, characterised in that a valve (5) for control of inhaled and exhaled air is arranged in the tubular body in connection to the protection (2).

5. (currently amended) Apparatus according to ~~any of the preceding claims~~ claim 1, characterised in that the tubular body (6) may be formed of a thin film, such as a plastic film, that forms a defined air channel, that the formed air channel of the film surrounds a helical strip (12) arranged in the air channel, that in elongated state substantially corresponds to the length formed by the air channel.

Appl. No.

6. (currently amended) Apparatus according to ~~any of the~~
~~claims 1-4~~ claim 1, characterised in that the tubular body (6')
is formed of a thin-walled, elastic and flexible material, which
is provided with folds (13), which admits that it can be
compressed, compacted, to a compact little and substantially flat
space saving unit.
